$$n=\frac{(2s+1)}{(2\pi)^d}\int_{k< k_f}d^dk,\quad d\text{ dimensions},$$

$$\{\Psi_s(\vec{x}),\Psi_{s'}^\dagger(\vec{y})\}=\delta^3(\vec{x}-\vec{y})\delta_{ss'},$$

$$\Psi_s^\dagger(\vec{r})=\frac{1}{\sqrt{V}}\sum_{\vec{k}}e^{i\vec{k}\cdot\vec{r}}a_s^\dagger(\vec{k}),~~\{\Psi_s(\vec{x}),a_\alpha^\dagger\}=\phi_{\alpha,s}(\vec{x}).$$

1. Consider a one-dimensional world where a type-**A** particle of mass M has zero momentum and decays to two type-**B** particles. The type-**B** particles are massless. The interaction is of the form

$$V = g \int dx (\Psi_B^\dagger(x) + \Psi_B(x))^2 [\Phi_A(x) + \Phi_A^\dagger(x)].$$

The field operators are defined by

$$\Phi_A^\dagger(x) = \frac{1}{\sqrt{L}} \sum_k e^{-ikx} a_k^\dagger, \quad \Psi_B^\dagger(x) = \frac{1}{\sqrt{L}} \sum_k \frac{1}{\sqrt{E_k}} e^{-ikx} b_k^\dagger.$$

Calculate the rate at which the type-**A** particle decays into a type-**B** particle.

2. Consider the following matrix element,

$$\mathcal{M}(m_i, m_f) = \langle \ell_f = 2, m_f | P_x^2 + P_y^2 | \ell_i = 4, m_i \rangle.$$

- (a) For which combinations of m_i, m_f is \mathcal{M} non-zero?
- (b) If one were to calculate the matrix element

$$\mathcal{M}(m_i = 0, m_f = 0) = \langle \ell_f = 2, m_f = 0 | P_x^2 + P_y^2 | \ell_i = 4, m_i = 0 \rangle,$$

express the non-zero elements from (a) in terms of $\mathcal{M}(0, 0)$. You can leave the answer in terms of ratios of Clebsch-Gordan coefficients.

3. Electrons are confined to a two-dimensional surface to move in the $\mathbf{x} - \mathbf{y}$ plane ($\mathbf{z} = \mathbf{p}_z = \mathbf{0}$). The areal density of electrons, number of electrons per area, is σ . Electrons of the same spin have the same energy until a magnetic field is added along the \mathbf{z} axis. This gives the interaction,

$$\mathbf{H}_B = g_s \mu_B B \frac{s_z}{\hbar},$$

where $\mu_B = e\hbar/2mc$, is the Bohr magneton and $g_s = 2$. Note the sign is positive above because the magnetic moment of the electron is negative (due to its negative charge).

- (a) In terms of \mathbf{m} and σ , what are the Fermi energy, ϵ_{f0} , and the Fermi wave number, \mathbf{k}_{f0} , when $\mathbf{B} = \mathbf{0}$?
- (b) What is the aerial magnetic moment density, \mathbf{M}_z , for small fields?

$$\mathbf{M}_z = \frac{1}{2} g_s \mu_B (\sigma_\downarrow - \sigma_\uparrow) = \chi \mathbf{B}.$$

where σ_\uparrow is the aerial density of spin-up electrons. Express χ in terms of g_s, e, \hbar, m, c and \mathbf{k}_f .
